# OIL-nax

Degreasing Liquid 【 Alkaline electrolysed type 】

Gentle to the user and environment

## 1 Miniaturisation

**Miniaturises** miniaturises oil faster than surfactant separates oil.

## 2 Dispersion

**Water dispersion** is achieved during the drainage process. (Miniaturised oil particles further disperse)

## 3 Biological decomposition

**Biological decomposition** takes place before the secondary pollution (adhesion and solidification of oil to drain pipes and oil becoming sludge) occurs.

## Features of OILnax<sup>®</sup>

Beautify and improve drain system

After cleaning grease in the drain pipe, water dispersion is achieved during the drainage process. Oil solidified inside pipe break down with continued use of OILnax and n-Hex value is expected to drop.

Safe / peace of mind

Being conscious about the environment, only high-grade natural materials are used. Hazardous material specified by the PRTR (Pollutant Release and Transfer Register) is not used.

Gentle to people and environment

Many of commercial detergents for dishwasher use inorganic chemicals, such as sodium hydroxide (caustic soda). OILnax alkaline electrolysed type is a cleanser that maintains its alkaline property and has increased cleaning power achieved by applying electricity to water and giving energy to water itself. It does not require a rinsing agent. It is not a non-pharmaceutical hazardous substance so no qualification is required and anyone can handle it.

## Usage and application of OILnax<sup>®</sup>

For industrial dishwasher

※ Automatic feeding device for liquid cleanser was used. Please contact us for the equipment specification and further information on the application.
